

① Multi-start initialization: the proposer edits system prompt + skill, widening the search space.

② A brief is evidence read through a frozen policy: it can shift what the proposer believes, not how it decides. RL moves the policy itself (node 1); here the frozen policy rebuilds the weak 0.955 seed -- 20/20 evals, below the shared start.

③ Machinery only this route can add: inherited skills force diversity -- cycle 8-12 step-function families, reinitializing every 100-300 steps instead of riding one basin; this jump's seed traces to them by hash. The proposer even writes the rule as code: an `enforce_diversification` middleware forces a family switch after 5 stalled iterations, and a new function class after 3 stalled families. Executor updates keep the harness fixed and cannot author any of this.
